

Customer Part:

Description

- A disciplined OCXO incorporating a GNSS receiver unit to give 1PPS and 10MHz output. With 1.5µs holdover stability achieved by using an adaptive algorithm. Standard NMEA0183 data is available to the user via a serial port.
- Model IQCM-112
- Model Issue number 1
- Working States (Workflow Diagram):
Run1: Fast track. Adjust the OCXO 10MHz output frequency quickly to track the GNSS.
Run2: Slow track. Adjust the OCXO 10MHz output frequency slowly when phase error is in the defined range.
Holdover: No GNSS input present; an algorithm enables adaptive modelling of the frequency stability of an OCXO with reference to the GNSS timing signal.
Free Run: Clock module powered up with no GNSS input.
- NMEA Data Words: GNSS data is available to the user via the interface on Pin 6 and Pin 7. These are broadcast every second in sync with the 1PPS output.
- Note 1: The IQCM-112 should be left powered and running for 7 days minimum before operation to allow for the OCXO's internal drift to stabilise.
Note 2: The adaptive module algorithm can be built after 3 days operation with good GNSS signal, however this data will be lost at power down.
Note 3: When State Input (Pin 8) is set low the IQCM-112 will operate in Holdover mode regardless of the 1PPS signal condition.
